

Lab 4: VibeCoding - Chat History

Repo: SETAPESU26/37_climber (forked to pmanoharreddy/37_climber) | Date: 07-10-2026

USER

[Attached: Lab_4_VibeCoding_Student_handout.pdf]

https://github.com/SETAPESU26/37_climber what ever has to be done here do it for me

CLAUDE

[Claude opened the repo, read the README and game.py, then made the changes below as four separate commits and tested the game headless with no display.]

I fixed the bug and implemented all three features in game.py, one commit per task. I tested it headless with no display (2,000 frames ran without errors), but I haven't played it with a window open.

What I changed

1. **Height bug:** self.height was reassigned from the player's current position every frame. It is now max(self.height, current_height), so the HUD shows your best height and never drops when you come back down.
2. **platform_color:** a smooth gradient from green at the ground to purple at the top.
3. **moving_platform_speed:** every third platform moves, at speed 1 in the lower half and 2 in the upper half. I used whole numbers because pygame.Rect truncates floats, which would make a 1.5 speed stall.
4. **on_coin_collected:** a burst of 14 yellow sparkles at the coin, plus a "Combo xN!" counter in the HUD. The combo shows from 2 coins and resets when you fall or press R.

What you still need to do yourself

- **Push to GitHub:** I can't push to your account. Fork the repo (don't open a PR to SETAPESU26), then either copy my game.py in and commit it, or apply my patches, which keep the four separate commits.
- **Videos:** run `pip install pygame` and `python game.py`. For the "before" video, use the original code and show the height dropping when you come back down. For the "after" video, show the colored platforms, the moving ones, and the coin sparkles.
- **Chat export:** the handout requires the chat history as a doc or PDF in the Lab-4 folder, so export this conversation.

Your instructor expects you to work through the prompting yourself, so read through the diffs and make sure you can explain each change before you submit.

[Files provided: game.py and four .patch files, one per task]

USER

what should i do now

CLAUDE

Here's the order I'd do it in:

1. **Fork the repo.** Go to https://github.com/SETAPESU26/37_climber, click Fork, and keep it in your personal account. Don't open a PR back to SETAPESU26.
2. **Clone your fork and record the "before" video.** Do this before applying any changes:

```
git clone https://github.com/<your-username>/37_climber
cd 37_climber
pip install pygame
python game.py
```

Record about 10 seconds. Climb up, then drop back down so the Height in the HUD visibly decreases. That shows the bug.

3. **Apply my four commits.** Download the four .patch files into a folder, then run: `git am /path/to/patches/*.patch`
4. **Record the "after" video.** Show the colored platforms, the moving ones, the coin sparkles, and the Height staying at its peak.

5. **Make the Lab-4 folder and push.** Put the videos, the updated code and the chat export in it, then git add ., git commit, git push.
6. **Export this chat** as a PDF or doc and add it to the Lab-4 folder.
7. **Read through the code before you submit.** Make sure you understand the four diffs.

USER

after forking

CLAUDE

After forking, do these in order.

1. Clone your fork

```
git clone https://github.com/<your-username>/37_climber
cd 37_climber
```

Replace <your-username> with your GitHub username.

2. Install pygame and run the original game

```
pip install pygame
python game.py
```

3. Record the "before" video (about 10 seconds)

Climb up, then fall or jump back down so the Height in the HUD visibly drops. Save the video as before.mp4.

4. Apply my changes

```
git config user.name "Your Name"
git config user.email "your-github-email"
git am ~/patches/*.patch
git log --oneline
```

You should see four new commits, one for each task.

5. Run it again and record the "after" video

Show the colored platforms, the moving platforms, the coin sparkles and combo text, and the Height staying at its peak. Save the video as after.mp4.

6. Add the deliverables and push

```
mkdir Lab-4
cp game.py Lab-4/
git add .
git commit -m "Add Lab-4 deliverables"
git push
```

USER

[Excerpt from previous Claude message:]

```
git clone https://github.com/<your-username>/37_climber
cd 37_climber
```

where should i run thi

CLAUDE

Run them in a terminal on your own computer.

Open a terminal

- Windows: press the Windows key, type cmd or PowerShell, and press Enter. If you installed Git for Windows, "Git Bash" also works.
- Mac: press Cmd+Space, type Terminal, and press Enter.
- VS Code: open the Terminal menu and choose New Terminal.

Pick where the project will go

The clone creates a new folder wherever you run it, so move somewhere you can find it first, such as your Desktop: cd Desktop

Then run the clone

```
git clone https://github.com/<your-username>/37_climber
```

```
cd 37_climber
```

Replace <your-username> with your real GitHub username, and don't keep the angle brackets.

If you get "git is not recognized"

Git isn't installed. Download it from <https://git-scm.com/downloads>, install it, then close and reopen the terminal.

USER

```
fatal: unable to access 'https://github.com/<your-username>/37_climber/': The requested URL returned error: 400
```

```
PS C:\Users\IP MANOHAR REDDY> git clone https://github.com/<pmanoharreddy>/37_climber
```

```
Cloning into '37_climber'...
```

```
fatal: unable to access 'https://github.com/<pmanoharreddy>/37_climber/': The requested URL returned error: 400
```

CLAUDE

The angle brackets < > are the problem. They're only placeholders, so GitHub gets an invalid URL and returns the 400 error. Leave them out.

Run this instead:

```
git clone https://github.com/pmanoharreddy/37_climber
cd 37_climber
```

Two things to check:

- Is pmanoharreddy your exact GitHub username? Open https://github.com/pmanoharreddy/37_climber in your browser. If it shows your forked repo, the username is right. If you get a 404, either the username is different or you haven't forked the repo yet.
- Have you clicked Fork? The repo must exist under your account before you can clone it.

USER

pmanoharreddy this is my github user name

CLAUDE

Then the command should work once the angle brackets are gone. Run exactly this:

```
git clone https://github.com/pmanoharreddy/37_climber
cd 37_climber
```

If it still fails, check these:

1. Did you fork the repo? Open https://github.com/pmanoharreddy/37_climber in your browser. If you see a 404, go to https://github.com/SETAPESU26/37_climber, click Fork, then Create fork, and run the clone again.
2. Is the fork named differently? If you renamed it while forking, use the name shown in your browser's address bar.
3. A different error? Paste it here and I'll help with that one.

USER

[Screenshot: GitHub page of SETAPESU26/37_climber, signed in as pmanoharreddy]

CLAUDE

Your screenshot shows you're signed in as pmanoharreddy, but you're on the original repo (SETAPESU26/37_climber). Your fork lives at a different address.

I can see a tab at the far right titled pmanoharreddy/37_cl... That may be your fork already.

1. **Check that tab.** If the address bar says github.com/pmanoharreddy/37_climber and shows "forked from SETAPESU26/37_climber", the fork exists.
2. **Create the fork if it doesn't exist.** On the original repo page, click Fork, leave the name as 37_climber, then click Create fork.
3. **Copy the clone link from your fork.** Click the green Code button, make sure HTTPS is selected, and copy the URL.

4. Clone it in your terminal:

```
git clone https://github.com/pmanoharreddy/37_climber.git
cd 37_climber
```

USER

```
PS C:\Users\P MANOHAR REDDY> git clone https://github.com/pmanoharreddy/37_climber.git
Cloning into '37_climber'...
remote: Enumerating objects: 8, done.
Receiving objects: 100% (8/8), 5.26 KiB | 1.05 MiB/s, done.
PS C:\Users\P MANOHAR REDDY> cd 37_climber
PS C:\Users\P MANOHAR REDDY\37_climber>
```

CLAUDE

The clone worked, and you're now inside your fork's folder. Next:

1. Install pygame and run the original game

```
pip install pygame
python game.py
```

If python isn't recognized, try `py game.py` and `py -m pip install pygame`.

2. Record the "before" video (about 10 seconds)

Press Win+G to open the Xbox Game Bar, or use the Snipping Tool's video recording. Climb a few platforms, then drop back down so the Height in the HUD visibly goes down. Save it as `before.mp4`.

3. Get the patch files and put them in one folder, for example `C:\Users\P MANOHAR REDDY\patches`.

4. Set your git identity

```
git config user.name "P Manohar Reddy"
git config user.email "your-github-email"
```

5. Apply the patches

```
git am (Get-ChildItem C:\Users\ "P MANOHAR REDDY" \patches \*.patch | ForEach-Object FullName)
git log --oneline
```

6. Run it again and record the "after" video and save it as `after.mp4`.

USER

[Screenshot: original Climber game running, HUD showing Height: 3m Coins: 0 Lives: 3, all platforms green]
after this

CLAUDE

The original game is running: the platforms are all green and the HUD shows Height: 3m. That's what the "before" video should show.

1. Record the "before" video now (about 10 seconds). Climb up a few platforms using A/D to move and Space to jump. Then drop back down to a lower platform or the ground. Keep the HUD in view so the Height number visibly goes down. That is the bug.

2. Close the game window, then go back to the terminal.

3. Get my patch files onto your computer and save them in a folder such as `C:\Users\P MANOHAR REDDY\patches`.

4. Apply the patches with `git am`, then check with `git log --oneline`. You should see four new task commits.

5. Run the new version and record the "after" video. The platforms will shade from green to purple as you climb, every third platform will move, coins will sparkle, and the Height will hold at its peak.

USER

what is the bug that i should record

CLAUDE

The bug: the Height number in the HUD goes down when you move down. It should show the best height you've reached and never decrease.

How to show it in the video (about 10 seconds):

1. Start recording with the game open.
2. Jump up a few platforms so Height rises, for example to 20m or 30m.
3. Let yourself fall, or walk off the edge of a platform, and land on a lower platform (not off the bottom of the screen, since that costs a life).
4. Watch the HUD. Height drops, for example from 30m back to 15m. That drop is the bug.
5. Stop recording.

Keep the top-left HUD in the frame the whole time. In the fixed version, the number rises as you climb and then stays at its peak when you come back down.

USER

explain me in simple words

CLAUDE

The bug in one line: the game forgets how high you got.

Think of it like a high score. If you climb to 30m and then come down to 15m, the screen should still say "30m", because that's the highest you reached. In the broken game, it changes to "15m". That's wrong.

What you need to record (10 seconds):

1. Start the game and jump up a few platforms. Watch "Height" go up, for example to 20m.
2. Step off a platform and land on one lower down.
3. Look at "Height" in the top-left corner. It goes down (for example 20m to 10m).
4. Stop recording.

That drop is the bug, and the video proves it. After the fix, the same steps keep the number at 20m when you come down.

Why it happened: the old code calculated the height fresh every frame from where you're standing right now. My fix makes the game keep the biggest number it has ever seen.

USER

after recording what next

CLAUDE

Once before.mp4 is saved, do these steps in order.

1. Close the game window.
2. Download my files from this chat: game.py and the four .patch files. Put the .patch files in a folder like C:\Users\P MANOHAR REDDY\patches.
3. Apply my changes. In your terminal (inside ...\37_climber), run:

```
git config user.name "P Manohar Reddy"
git config user.email "your-github-email"
git am (Get-ChildItem "C:\Users\P MANOHAR REDDY\patches\*.patch" | ForEach-Object FullName)
git log --oneline
```
4. Run the fixed game with python game.py and record after.mp4.
5. Make the Lab-4 folder (mkdir Lab-4, copy game.py Lab-4), add the videos and chat PDF, then git add ., git commit, git push.
6. Export this chat as a PDF and keep the share link for the submission.

USER

[Screenshot: file cards for game.py and the four .patch files]
should i download all this now

CLAUDE

Yes, download all five files: game.py and the four .patch files. You can click Download all at the bottom, or download each one separately.

Do this first: make sure you've already recorded before.mp4 with the original game. Once the patches are applied, the bug is fixed, so you can't record "before" any more.

Then:

1. Create a folder C:\Users\P MANOHAR REDDY\patches.
2. Move the four .patch files into it. If you got a zip, right-click it and choose Extract All first.
3. Keep game.py as a backup.
4. In your terminal, inside 37_climber, apply the patches with git am and check with git log --oneline.

USER

now now i should place .patches in patches folder right

CLAUDE

Yes. Put only the four .patch files in the patches folder: C:\Users\P MANOHAR REDDY\patches.

1. Create the folder if it doesn't exist: mkdir "C:\Users\P MANOHAR REDDY\patches"
2. Move the four .patch files into it. They're probably in your Downloads folder.
3. Don't move game.py. Leave it in Downloads as a backup.
4. Check the files are there: dir "C:\Users\P MANOHAR REDDY\patches". You should see four files starting with 0001, 0002, 0003 and 0004.

Then go to your project folder (37_climber) and apply them with git am.

USER

i have cloned teh github what next

CLAUDE

You've already cloned the repo and run the original game, so the next steps are these.

1. Record before.mp4 (if you haven't yet).
2. Put the four .patch files in a folder such as C:\Users\P MANOHAR REDDY\patches.
3. Apply them with git am, then run git log --oneline. It should list four new commits (Task 1 to 4) on top.
4. Run the fixed game and record after.mp4.
5. Make the Lab-4 folder, add your files and push.

USER

KeyboardInterrupt

```
PS C:\Users\P MANOHAR REDDY\37_climber> git config user.name "P Manohar Reddy"
```

```
PS C:\Users\P MANOHAR REDDY\37_climber> git config user.email "your-github-email"
```

```
PS C:\Users\P MANOHAR REDDY\37_climber> git am (Get-ChildItem "C:\Users\P MANOHAR REDDY\patches\*.patch" | ForEach-Object FullName)
```

Applying: Task 1: Fix height score so it tracks best height reached

Applying: Task 2: Implement platform_color gradient (green to purple)

Applying: Task 3: Implement moving_platform_speed (every third platform moves)

Applying: Task 4: Implement on_coin_collected with sparkle effect and combo counter

```
PS C:\Users\P MANOHAR REDDY\37_climber> git log --oneline
```

bd181c4 (HEAD -> main) Task 4: Implement on_coin_collected with sparkle effect and combo counter

8342611 Task 3: Implement moving_platform_speed (every third platform moves)

1897ce2 Task 1: Fix height score so it tracks best height reached

63be6df (origin/main, origin/HEAD) edit readme for submission reqs

ad335a8 push climber

CLAUDE

All four patches applied cleanly, and the log shows your four task commits (Task 1 to 4) on top of the original ones.

1. Run the fixed game and record after.mp4 (about 10 seconds)

Show the platforms shading green to purple, some platforms sliding sideways, sparkles when you grab a coin (and "Combo x2" for two in a row), and Height staying at its peak after you come down.

2. Fix the commit author (recommended)

The patches carry my placeholder author ("Student"), and your email is still set to your-github-email. Run this so the commits show you as the author:

```
git config user.email "your-real-github-email"
git rebase origin/main --exec "git commit --amend --reset-author --no-edit"
git log --format="%h %an %s"
```

3. Add the Lab-4 folder and push

Put game.py, before.mp4, after.mp4 and your chat PDF in Lab-4, then `git add .`, `git commit -m "Add Lab-4 deliverables"`, `git push`.

USER

```
PS C:\Users\IP MANOHAR REDDY\37_climber> git config user.email "your-real-github-email"
PS C:\Users\IP MANOHAR REDDY\37_climber> git rebase origin/main --exec "git commit --amend --reset-author --no-edit"
[...four commits amended...]
Successfully rebased and updated refs/heads/main.
PS C:\Users\IP MANOHAR REDDY\37_climber> git log --format="%h %an %s"
f4540bd P Manohar Reddy Task 4: Implement on_coin_collected with sparkle effect and combo counter
15f1e66 P Manohar Reddy Task 3: Implement moving_platform_speed (every third platform moves)
7359d50 P Manohar Reddy Task 2: Implement platform_color gradient (green to purple)
f74e4ac P Manohar Reddy Task 1: Fix height score so it tracks best height reached
63be6df Vishwambhara R Hebbalalu edit readme for submission reqs
ad335a8 Vishwambhara R Hebbalalu push climber
```

CLAUDE

The rebase worked and your name is now on all four commits. But you ran the command with the literal text `your-real-github-email`, so the commits carry that placeholder as the email. GitHub can't link those commits to your account.

1. Find your GitHub email. Open <https://github.com/settings/emails>. Either use your real email, or the private noreply address GitHub shows there.

2. Set it and redo the rebase (replace with your actual address):

```
git config user.email "your-actual-email"
git rebase origin/main --exec "git commit --amend --reset-author --no-edit"
git log --format="%h %an <%ae> %s"
```

3. Record after.mp4.

4. Add the Lab-4 folder and push.

USER

[Screenshot: GitHub Settings > Emails showing primary verified email `manoharreddy31027@gmail.com`]

CLAUDE

Your primary verified email is `manoharreddy31027@gmail.com`, and "Keep my email addresses private" is Off. So you can use that address directly.

1. Set the email and redo the rebase

```
git config user.email "manoharreddy31027@gmail.com"
```

```
git rebase origin/main --exec "git commit --amend --reset-author --no-edit"
git log --format="%h %an <%ae> %s"
```

The four task commits should now show <manoharreddy31027@gmail.com>.

2. Record after.mp4, then 3. add the Lab-4 folder and push.

If git push is rejected because of the email, turn on "Keep my email addresses private" on that settings page, use the noreply address it shows, and repeat step 1.

USER

manoharreddy31027@gmail.com is my email

CLAUDE

Good, that matches the email in your screenshot. Run these in your terminal, inside 37_climber:

```
git config user.email "manoharreddy31027@gmail.com"
git rebase origin/main --exec "git commit --amend --reset-author --no-edit"
git log --format="%h %an <%ae> %s"
```

The four task commits should now show P Manohar Reddy <manoharreddy31027@gmail.com>.

After that: record after.mp4, make the Lab-4 folder with the deliverables, then git add ., git commit -m "Add Lab-4 deliverables", git push.

USER

```
i have recorded the game before doing git config user.email "manoharreddy31027@gmail.com"
git rebase origin/main --exec "git commit --amend --reset-author --no-edit"
git log --format="%h %an <%ae> %s" this
```

CLAUDE

That's fine. The email and rebase commands only change the commit author info, not the game code, so your video is still valid.

One quick check: did you record the "after" video with the patched version? That means the platforms were shading green to purple, some were moving, and the coins sparkled. If you only recorded the original game, you'll need to record it again.

Assuming both videos are done, run the email and rebase commands, create the Lab-4 folder with your deliverables, and push. Each file must be under 100 MB.

USER

```
PS C:\Users\P MANOHAR REDDY\37_climber> git config user.email "manoharreddy31027@gmail.com"
PS C:\Users\P MANOHAR REDDY\37_climber> git rebase origin/main --exec "git commit --amend --reset-author --no-edit"
[...four commits amended...]
Successfully rebased and updated refs/heads/main.
PS C:\Users\P MANOHAR REDDY\37_climber> git log --format="%h %an <%ae> %s"
87679d5 P Manohar Reddy <manoharreddy31027@gmail.com> Task 4: Implement on_coin_collected with
sparkle effect and combo counter
a6c049b P Manohar Reddy <manoharreddy31027@gmail.com> Task 3: Implement moving_platform_speed
(every third platform moves)
3c50c50 P Manohar Reddy <manoharreddy31027@gmail.com> Task 2: Implement platform_color gradient
(green to purple)
fad15c9 P Manohar Reddy <manoharreddy31027@gmail.com> Task 1: Fix height score so it tracks best height
reached
63be6df Vishwambhara R Hebbalalu <vishwambharah@gmail.com> edit readme for submission reqs
ad335a8 Vishwambhara R Hebbalalu <vishwambharah@gmail.com> push climber
```

CLAUDE

All four task commits now show your name and your real email, so that part is done.

1. Create the Lab-4 folder and copy game.py in

```
mkdir Lab-4
copy game.py Lab-4\
```

2. Add before.mp4, after.mp4 and your chat PDF to Lab-4 (run explorer Lab-4 to open the folder).

3. Check the file sizes with dir Lab-4. Each file must be under 100 MB.

4. Commit and push

```
git add .
git commit -m "Add Lab-4 deliverables"
git push
```

5. Check on GitHub at https://github.com/pmanoharreddy/37_climber that the Lab-4 folder and your four task commits are there.

USER

```
PS C:\Users\P MANOHAR REDDY\37_climber> mkdir Lab-4
Directory: C:\Users\P MANOHAR REDDY\37_climber
d----- 07-10-2026 11:21 Lab-4
PS C:\Users\P MANOHAR REDDY\37_climber> copy game.py Lab-4\
```

CLAUDE

The Lab-4 folder is created and game.py is copied in (PowerShell doesn't print anything for a successful copy).

1. Open the folder and add your other files with: explorer Lab-4. Drag in before.mp4, after.mp4 and your chat PDF.
2. Check that everything is there with: dir Lab-4
3. Commit and push with git add ., git commit -m "Add Lab-4 deliverables", git push.
4. Verify on GitHub.

USER

[Excerpt from previous Claude message:]
for a successful copy).

1. Open the folder and add your other files
explorer Lab-4
gove me path for this

CLAUDE

The path to the Lab-4 folder is:

C:\Users\P MANOHAR REDDY\37_climber\Lab-4

You can open it in File Explorer in either of two ways:

- Run explorer Lab-4 in your terminal. It opens that folder because you're already inside 37_climber.
- Or paste the full path into the File Explorer address bar and press Enter.

Then drag before.mp4, after.mp4 and your chat PDF into that folder.

USER

```
Mode LastWriteTime Length Name
-a---- 07-10-2026 11:17 8618856 After.mp4
-a---- 07-10-2026 11:04 4995351 Before.mp4
-a---- 07-10-2026 11:20 9353 game.py
```

CLAUDE

The files are in place and the sizes are fine (about 8.6 MB and 5 MB, well under GitHub's 100 MB limit). Only the chat export is missing.

1. Export this chat as a PDF and drag it into Lab-4.

2. Check the folder again with `dir Lab-4`. You should see four files.
3. Commit and push with `git add .`, `git commit -m "Add Lab-4 deliverables"`, `git push`.
4. Verify on GitHub.
5. Keep the chat share link for the submission.

USER

ctrl p is only giving 1 page

CLAUDE

Browser print often captures only one page because the chat scrolls inside its own panel. Here are three ways around it.

Option 1: Copy and paste into a document (most reliable). Press Ctrl+A in the chat, then Ctrl+C. Paste into Word or Google Docs and save or download it as a PDF.

Option 2: Try printing again with tweaks. Turn on Background graphics under More settings, and zoom the browser out to about 50% before pressing Ctrl+P.

Option 3: Use the share link as well. The README says to submit the chat link with the full history.

USER

convert all this chat to pdf

CLAUDE

[This document is the PDF of this conversation, generated at your request. Screenshots and long terminal outputs are summarised in square brackets.]
